

Corrections in itslearning, December 2014

48 corrections are included in the update that was released in December 2014. The most important are listed below.

Lessons did not support video/audio recording

Issues with audio recordings in lessons are fixed by providing a link to the audio file that can be clicked to play. This fix is applied to the publish action, so old lessons with audio recordings should be republished manually by the user.

Permanent deletion from trash can failed

Some users reported that courses could get stuck in permanent delete status. When this situation occurred no other courses could be permanently deleted and the permanent deletion queue continued to increase. The error was related to assessment logs and has now been addressed.

Submission status row could not be deleted

It is now possible to delete unused submission status rows.

Issue with transfers from working portfolios to assessment portfolios

If assignment titles contained special characters transfers from working portfolios to assessment portfolios sometimes failed. Now only valid characters from the assignment title are used.

Copied planners did not apply customisations to target

This issue has been addressed.

Planner and filter errors

Previously, if a user had a large number of plans in the planner in addition to multiple text columns, the planner failed to load. This has now been addressed and all plans load successfully. We have also improved the performance of large planners.

Printing selected lessons from planner

You can now print selected lessons. We have added a new "Print" option to the Actions menu in the topic's toolbar. You can only print lessons from one topic at the time.

Survey questions: change sequence error

Previously, upon changing the sequence of questions in surveys an extra symbol appeared near the question. This has now been addressed.

Attendance sorting on categories

Sorting on categories in the mentor's attendance report did not work as intended, but the issue has now been addressed.

Various issues with the new message composer

Recipients input field clears all unmatched input, so that users can have clear understanding whether their input is accepted or not.

The person auto-suggest pop-up has been improved.

It's now possible to find users with double names in the messages pop-up.

Issues with fill-in-the-blank alternatives

In fill-in-the-blank questions in tests, alternatives to the blanked text failed if they contained a leading white space. Now the text is trimmed and leading space will be removed.

iPhones and scrolling in the calendar

When viewing the calendar in a browser on iPhone (Safari), it was not possible to scroll vertically on calendar events without them being opened for editing. This has now been addressed.

Sorting issue in working portfolio

Previously 'Lastname, Firstname' view was sorted by firstname. It now sorts on lastname as expected.

News content block improvements

A few improvements have been added:

1. A new draft option with a "Draft" checkbox above the editor which is by default set to OFF
2. We have renamed 'Read permission' to 'Visible to'
3. Only author can see draft news

Performance problems in admin mentor view

An "Oops error" could occur when having a combination of many mentors and large organisations. Queries used on this page have been improved and the issue is solved.
